Prometheus: what is still missing

Updated 11 November 2026. Version 1.4. Built and tested here: 738 tests pass.

Not yet run end to end on the owner's real laptop.

Just finished

- **Own icon and name**: window, taskbar, shortcuts, tray, notifications and browser tab show Prometheus, not Python.
- **Voice fixes**: the AI now always knows the date and time (the "location instead of time" bug); instant answers with no AI for time, date, opening apps and sites, timers, reminders, volume, battery and weather; three speech models in Settings (fast, Indian-accent English, English + Hindi); actions said back before they happen; timings shown in Settings.
- **Tray icon and notifications** (22), **cost page** (23), **own tools** (25), **safety check** (28), **voice training** (30) and the **small fixes** (31).
- **Search inside files** (14), **linked facts that keep their history** (15, 16), **nightly memory tidy-up** (17) and **photos: tags, text and sorting** (18).
- **Daily summary**: morning briefing (08:00) and evening wrap-up (21:00) with weather, calendar, important email, reminders and what Prometheus did.
- **Email alerts and webhooks**: new mail from chosen senders every 5 minutes; a secret webhook address other apps (like GitHub) can call.
- **Browser automation**: its own visible Edge window and profile; pay/order on the Approvals page, sign in/submit/post asked in the chat, passwords typed only by you, Take over button.
- **Code sandbox**: scripts shown and asked first; Windows Sandbox when the laptop has it, otherwise a locked-down Python with no internet (asked per run), no access to your folders or keys, time and memory limits.
- **Google Calendar and Drive**: add and move events (asked first), search and read Drive files.
- **Excel and slides**: tables become .xlsx with totals and charts; notes become .pptx decks with speaker notes.
- **Connections**: email from any provider (app password; reads without marking read; sending waits for approval), calendars through their secret iCal link, and any app with an MCP server (Notion, Slack, Spotify…).
- **Learning from failed tasks**: what failed and what worked is written down and used next time; general lessons become nightly rules.
- **Standing goals and watchers**: scheduled tasks ("every night tidy Downloads"); battery, disk, CPU and folder alerts.
- **Planning loop**: each step gets up to 3 tries, a different way each time; after actions it checks the goal really happened (app window open, files there); each task stops at $0.20 of paid AI or 12 steps.
- **Opening apps**: installed app first; if missing, its website, with an Install button in

the chat; with no website, it offers to install; if it can't be found, the Microsoft Store opens on a search.

1. Planning and autonomy

1. **Long goals in the background**: done (standing goals).
2. **Learning from its own failed tasks**: done.
3. **Daily summary**: done.

2. Senses and triggers

4. **Seeing the screen**: understand a screenshot so it can click "the Download button" instead of exact positions.
5. **Camera**: one photo when asked ("what am I holding?"), never always on.
6. **Watchers**: done (battery, disk, CPU, folders).
7. **Email and webhook triggers**: done.

3. Tools

8. **MCP support**: done (command or web address; changes asked in the chat).
9. **Browser automation**: done.
10. **Running code safely**: done. (The Windows Sandbox path is untested until the real laptop.)
11. **Gmail, Google Calendar and Drive**: done (needs your Google sign-in in Settings).
12. **Phone access**: on home Wi-Fi first (QR code), then anywhere with Tailscale.
13. **Excel and slides**: done.
14. **Search inside files**: done.

4. Memory

15. **Links between facts**: done.
16. **Replacing facts that changed**: done.
17. **Nightly memory tidy-up**: done (with Undo).

5. Photos and media

18. **Sort photos by what is in them**: done (tags, text in photos, sorting into folders after a yes).
19. **Sort the photos on the phone.**
20. **Make images and videos**: needs a cloud graphics card; the laptop has none.

6. Interaction and polish

21. **Hand gestures** with the webcam (finger tracking).

22. **Tray icon and notifications**: done.
23. **Cost dashboard**: done (monthly limit, warning at 80%).

7. Other agents

24. **Hermes agent** on the desktop PC.
25. **Self-edit level 2**: done (own tools, approved once by their code).
26. **Antigravity calling Prometheus** the other way round (Prometheus as a tool server).

8. Safety still to add

27. **Code sandbox**: done.
28. **Prompt-injection tests**: done (Safety check in Settings, run against the real planner).

9. Testing still owed

29. **First full run on the real laptop**: Wi-Fi on non-English Windows, WPA3 networks, voice on the real microphone, real GitHub and Antigravity calls, the reminder pop-up, the Edge browser window, Windows Sandbox, Google sign-in.
30. **Voice tuning**: training, better speech models and instant answers are built; still needs your real-microphone test (send the timings from Settings).
31. **Small leftovers**: fixed.

10. On the owner's side

32. **Claude API key** in Settings: this is what makes answers really good.
33. **GitHub token** for the own repository (fine-grained, one repo).
34. **Backups** (File History or OneDrive) on before big file sorting.
35. **2 or 3 exact tasks that went wrong**, to keep as permanent tests.
36. **Ollama running** for private answers (file and note questions use the local model only).

11. Suggested new features

37. **Study coach**: makes quizzes and flashcards from your notes and PDFs, then reminds you to review them on a spaced schedule (harder cards come back sooner). Scores show in the evening wrap-up.
38. **Money tracker**: reads bank and UPI emails ("Rs 450 debited at Swiggy"), adds each payment to one Excel sheet by category, and shows the day's and month's spending in the evening wrap-up. Stays on the laptop.
39. **Clipboard and screenshot memory**: remembers what you copied and the text in your screenshots, so "what was that link I copied this morning?" works. Passwords and card numbers are never kept.

40. **Focus mode**: "focus for 50 minutes": mutes alerts, closes or blocks distracting sites in its browser, holds non-urgent notifications, then gives a short summary of what came in.

41. **Weekly laptop health check**: every Sunday, disk space, big old files, startup apps slowing the laptop, Windows updates waiting, battery health, with one-click fixes asked first.

Suggested order

1. Phone on Wi-Fi (12)
2. Seeing the screen (4)
3. Sorting photos on the phone (19)
4. Study coach and money tracker (37, 38)
5. Focus mode, laptop health check, clipboard memory (39 to 41)
6. Camera, gestures, images and video (5, 20, 21)
